NEWTON'S TELECOM DICTIONARY

The Official Dictionary of
Telecommunications & the Internet

**10th Updated, Expanded and Much
Improved Edition**

Appendix A

DIX Digital Equipment Corp. The early 1980s consultation of many customers that produced the Ethernet Version 1 and Ethernet Version 2 variations of a DIXMAD multi access protocol. This DIX standard was then submitted to the IEEE, where after some modifications it was released as IEEE Standard 802.3. The DIX version did not include specifications for UTP or Fiber optic cable.

DIX Connectors A local area network connector. DIX connectors on the temporary local area network cable hook it to the network. The main DIX connector plugs into the Speedtek PC-16 and the female DIX connector attaches to an external transceiver.

DIX Ethernet The DIX, Intel, Xerox Ethernet standard, also known as version 1 or Busbox Ethernet. There are differences between IEEE 802.3 and the DIX Ethernet.

D1. Distribution list

2. Distance learning

DLC 1 Digital Local Channel. Network transmission equipment used to provide path gain on a local loop. The digital loop can be system driven, multiple channels, typically 64 Kbps word-grade, from a single bus-wide distribution cable using time from the central office to a remote site in the traditional environment. Central Office Termination (COT) continues multiplexing equipment in the central office (CO). A four wire twisted pair circuit is deployed from the CO in the remote location at the point of Remote Termination (RT), where it terminates in matching DLC electronics. From the remote side, the interface is joined to individual voice-grade local loops which extend to the individual customer premises. Effectively, individual DLCs are channel banks — devices which multiplex and demultiplex multiple channels over a high-bandwidth, electrical distribution facility. Such DLCs are used in situations in which the cost of the equipment is more than offset by the savings in distribution facilities through eliminating the need for a large number of individual copper pairs. Individual DLCs also are known as DLCs (Subscriber Loop Carrier systems).

In a more contemporary scenario, the carriers deploy high bandwidth fiber optic facilities from the CO to the RT. The carrier electronics at each end accomplish the effective conversion process, as well as that of multiplexing/demultiplexing. The final leg of the local loop remains extended twisted pair. This type of system can be characterized as a hybrid local loop system. Given the high cost of such conversion process, DLCs offer clear advantages in communication to FTTD (Fiber-to-the-Desk) and continuing to FTTB (Fiber-to-the-Basement). Additionally, the deployment of fiber optic distribution facilities yields much greater aggregate bandwidth — typically a minimum of 51.84 million bits per second, which is the critical requirement of 45 million bits per second (113) in the electrical world. See also SLC, Channel Bank, and Multiplexer.

2. See Data Link Control

3. Direct Line Connect An ARX1 Media term. An answering position used by system operators to answer calls, transfer calls, make calls, set up conference calls, and monitor system operations. Calls can ring on any of the line buttons, and system calls can ring simultaneously (unless the DLC where calls are sent to a common DCL queue and wait until a DCL is available to receive a call).

DLC1 Data Link Connection Identifier. A frame relay term denoting a 10-bit field in the Address field. The DLC1 identifies the data link and the connection identifier. See also Frame Relay.

See (DCL, Direct Connect, See (DCL) and (Connection) See Management Network (CL). See Time Alarms.

DLE Data Link Escape. A control character used exclusively to break bidirectional user control signals, control characters sequences or DLE sequences, to prevent something. Data Link Escape is a more advanced to the Control P non-print control character which is used to wrap the PAD from the main mode to its command mode in packet switching networks.

DLEK Data Link Exchange (DLEK). A company which offers high-speed access to the Internet, and not vice versa.

DLL 1 Dynamic Link Library. A feature of DOS/2 and Windows that allow executable code modules to be loaded in demand and linked at run time. They are usually used by third parties — translators in applications — and then invoked when they are no longer needed. Unlike a standard programming library whose functions are linked into an application with the application's code is compiled, an application that uses DLLs must wait until those DLL functions at runtime. Hence, the term dynamic.

2 Data Link Layer driver. A driver specification developed by DEC primarily to work with DECnet PC-SA for DOS. DLL 31 started driver specification, allowing multiple protocols to share a single network interface card.

DLP 1 to ATM term. Link Interference. Data Link Protocol Interference (DLPI) Specification. Protocol 2.0.1. (See WOL Data, August 1991).

DLR Design Layout Report. A description of how a layout is engineered. Often used between LEOs and CLECs. See LEO and CLEC.

DLS Data Link Switching. IBM's method for carrying SNA and NetBOS over T3/T4 operating at the Data Link level. DLS now an open Internet spec. can be used with OSPF or PPP.

DLSW Data Link Service Evaluation

DLSW Data Link Switching Workgroup. This workgroup has issued a new interoperability standard for integrating SNA and NetBOS over the T3/T4 protocol. According to IBM, the new DLSW standard provides interoperability and functionality and security offered by International RFC 1484 existing DLSW implementations.

DLSW Digital Link from Unit. An ARX1 term for a device which provides the interface to digital buses and lines such as T-1, EDSL, and remote line units.

DMA Data Modulation

DMA 1 Direct Memory Access. A fast method of moving data from a storage device or I/O interface unit directly to RAM where some processing is required. DMA is direct access memory by a peripheral device that bypasses the CPU.

2. United Business Association

3. Direct Access Management Assurance

4. Dispersed Market Area This term describes the program to area established by Atlantic World Research to the purpose of refining the effectiveness of commercial television advertising. DMA's represent the geographic areas covered by groups of competing commercial television broadcast stations. The boundaries of these areas are of considerable financial importance to the stations involved because the determine the number of viewers each station can claim, and hence the data amount the station can charge in advertising time. Station 75.55(a) of the FCC Rules provides that, in the purpose of the cable television rules, any area, the local market area of a commercial television broadcast station is the Nielsen DMA. A map showing DMA boundaries may be obtained from:

1250 Avenue of the Americas
New York, NY 10104-1001
212-750-7500

DMA Channel A channel for direct memory access that does not involve the microprocessor, providing data transfer directly between memory and a disk drive. See DMA.

DNR Digital Network Relay

DNR Differential Mode Delay. A fiber optic term. DNR refers to the fact that multitrack and monochrome (single track) fiber optic cabling systems differ considerably in their performance characteristics. Specifically, and in a LAN environment, some multitrack systems are not capable of supporting signals from high performance fiber optics, which operate at very high speeds and which emit narrow-defined pulses of light. Inductively, LEOs (light-emitting diodes) which operate at lower speeds and which emit light pulses of a broader range of frequencies, have been used in conjunction with multitrack fiber systems. In a LAN environment, such a configuration has proved very satisfactory, even at high speeds and over relatively long distances. The combination of LEOs and multitrack fiber also is much less costly. Emergent at 10/100 million bits per second, Token Ring at 4/16 million bits per second, and ATM at 25/155/622 million bits per second all have made use of this traditional combination. However, the emerging Digital Ethernet standard implies the use of laser diodes to achieve such speeds. Multitrack fiber, at least in some cases, appears to be unoptimum in this environment, even over short distances. The problem is DNR, which yields unacceptable performance levels of signal delay. See Media Dispersion.

DNI 1 Digital Multiplexed Interface. ARX1's Digital Multiplexed Interface. A PBX to computer interface that divides the T-1 trunk into 23 user channels and one signaling channel. Also used as a T-1 PBX to computer interface. See Open Application Interface.

2 Desktop Management Interface. A protocol independent management interface developed by the DMTF, the Desktop Management Task Force, a group working on improving network product. Making network products easier to use — more standard and easier to use — requires three basic elements: standardized definitions of printer objects, a protocol for communicating with these objects and an application interface. Question: What is DMTF?

Answer: The Desktop Management Interface (DMI) is a the result of a cooperative industry-wide effort to make PC systems easier to manage, use and control. Specifically, DMI is a specification developed by the Desktop Management Task Force (DMTF), a consortium of hardware, software, and peripheral vendors. DMTF describes hardware and software components in a format that can be easily accessed over a phone line by PC management applications and terminal support personnel. Thanks to DMTF, network support personnel and PC management applications can:

- Access an inventory of hardware and software components
- Access and change parameter values and settings
- View data generated by software agents and diagnostics

with DMTF technical support applications and PC management applications use a Management Interface (MI) to access most stored in Management Information Files (MIFs).

DMF-BOS Digital Multiplexed Interface-Bus. Directed Signaling. A form of signaling which uses the 24th channel of each DSI to carry signaling information, allowing other channels to carry data.

DMS Digital Multiplexed Switch. Central office switching system. There are DMS-1C, DMS-2, DMS-3, and DMS-4, the primary name.

DMT Discrete Multi-Tone

signal processors to perform of video, data, image and one pair carrier with Northern Telecom, provided "four A" channels at 1 channel may carry a "VCR" rate may be managed in a signal. In the future, all to be able to transport an extremely improved quality, channels are asymmetric, the telephone company to

• One ISDN "H zero" channel. This channel is a multi-rate ISDN Channel V wave. This channel cannot to corporate LANs for Northern Telecom's DMS4

• One ISDN Basic Rate at (64 Kbps) and one "D" channel. This channel allows the phone user to ISDN services without in the expense of a dedicated line. The extension of the channel to the home

• One signaling channel to the home user. VOA system, which provides an inverse search and push

• Extended operations channel, audio, and telephone. Finally, the home user over the same copper pair

• One signaling channel to the home user. VOA system, which provides an inverse search and push

• Extended operations channel, audio, and telephone. Finally, the home user over the same copper pair

• One signaling channel to the home user. VOA system, which provides an inverse search and push

• Extended operations channel, audio, and telephone. Finally, the home user over the same copper pair
